# 19.Zip (.Net 4)

Zip 是在 .Net4 支持的操作符。

## LINQ Zip 简介

将指定函数应用于两个序列的对应元素,以生成结果序列。

### LINQ Zip 示例

\* http://sikiedu.com liangxie

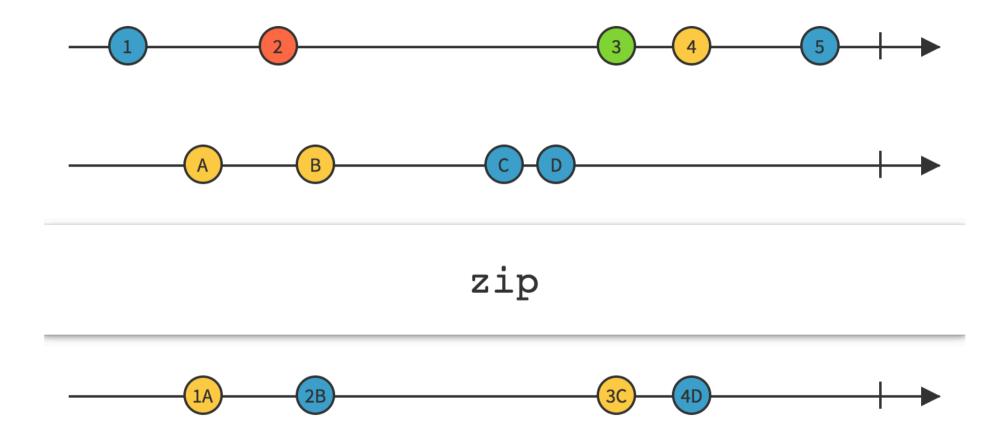

```
using System.Ling;
using UnityEngine;
namespace UniRxLesson
      public class LINQZipExample : MonoBehaviour
            private void Start()
                  int[] numbers = { 1, 2, 3, 4 };
                  string[] words = { "one", "two", "three" };
                  var numbersAndWords = numbers.Zip(words, (first, second) => first + " " +
second);
                  foreach (var item in numbersAndWords)
                        Debug.Log(item);
```

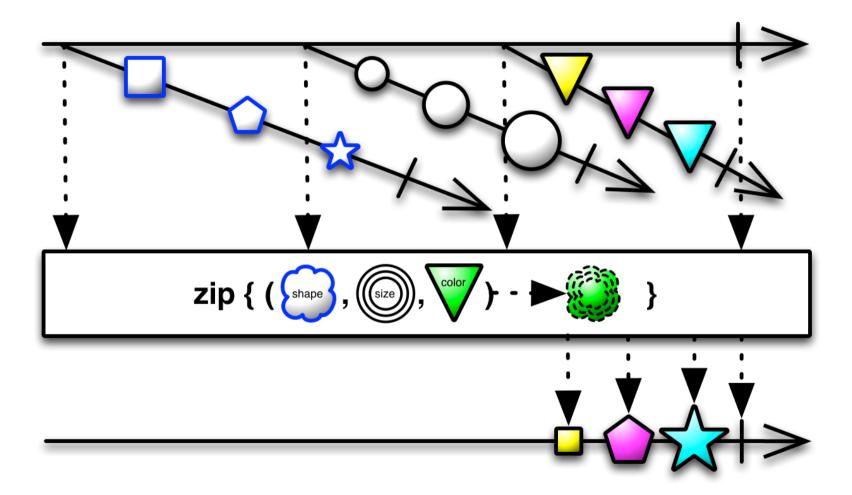

}

#### 输出结果为:

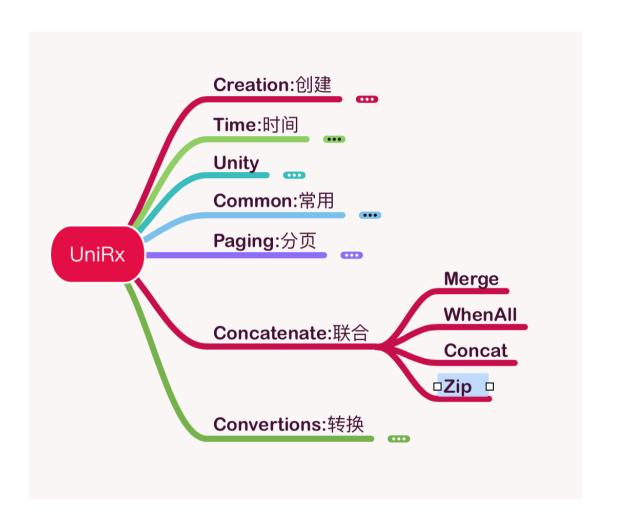

- 1 one
- 2 two
- 3 three

## UniRx Zip 示意图

## UniRx Zip 在知识地图中的位置

### UniRx Zip 示例代码

```
* http://sikiedu.com liangxie
using UniRx;
using UniRx.Triggers;
using UnityEngine;
namespace UniRxLesson
    public class ZipExample : MonoBehaviour
         private void Start()
             var rightStream = this.UpdateAsObservable().Where(_ =>
Input.GetMouseButtonDown(0));
```

```
var leftStream = this.UpdateAsObservable().Where( =>
  Input.GetMouseButtonDown(1));
                  leftStream
                       .Zip(rightStream, (l, r) => Unit.Default)
                       .Subscribe(_ => { Debug.Log("ok"); });
运行之后,点击鼠标的顺序为,左->右->左->右->左->左->左->右->右
   输出的结果为:
  // 左
  ok // 右
  // 左
  ok // 右
  // 左
```

// 左

```
// 左
ok // 右
ok // 右
ok // 右
```

#### 今天的内容就这些
