12. 加载场景 AsyncOperation

我们在异步加载资源或者异步加载场景的时候往往会用到 AsyncOperation。

UniRx 对 AsyncOperation 做了支持。使得加载操作可以很容易地监听加载进度。示例代码如下:

```
*******************
* http://sikiedu.com liangxie
******/
using UniRx;
using UnityEngine;
using UnityEngine.SceneManagement;
namespace UniRxLesson
   public class AsyncOperationExample : MonoBehaviour
   {
       void Start()
          var progressObservable = new ScheduledNotifier<float>();
SceneManager.LoadSceneAsync(0).AsAsyncOperationObservable(progressOb
servable)
                      .Subscribe(asyncOperation =>
                     {
                         Debug.Log("load done");
```

```
Resources.LoadAsync<GameObject>("TestCanvas").AsAsyncOperationObserv
able()
                                    .Subscribe(resourceRequest =>
                                    {
Instantiate(resourceRequest.asset);
                                    });
                       });
           progressObservable.Subscribe(progress =>
           {
               Debug.LogFormat("加载了:{0}", progress);
           });
       }
    }
}
输出结果为:
加载了:0.9
加载了:0.9
加载了:1
load done
编辑器视图为:
```

今天的内容就这些。
